

ASSIGNMENT 8: Deploy a project from a local machine to GitHub and vice versa.

Step 1: Create a GitHub Account and login. The GitHub Dashboard opens up, Click on Create Repository/New (In case of Blank / Existing Repository) or Click on Your Repository from the Profile section and then click on Create Repository/New.

Step 2: Give a name of the Repository and keep rest of the fields as it is and then click on Create Repository.

Step 3: The Repository gets created. Now copy the HTTPS URL of the Repository from the Quick setup section and save it to the clipboard for future reference.

Step 4: Now Create a folder in the local machine and insert a file into it. Right click on the white space of the folder and click on Open Git Bash here option.

Step 5: The Git Bash terminal opens up. Give the command step by step as mentioned in the images -

- ❖ **git init** : The git init command is used to create a new Git repository. It creates a hidden .git folder that stores all the repository-related information, allowing you to track changes, commit files, and collaborate using Git.
- ❖ **git add .** : The git add . command stages all changes (new, modified, and deleted files) in our repository for the next commit.
- ❖ **git config --global user.email "your@email.com"**: The git config --global user.email command followed by our email id sets it as the email address that will be associated with our commits globally across all Git repositories on our system.
- ❖ **git config --global user.name "Your_GH_Username"** : The git config --global user.name command followed by our GitHub Username sets it as the username that will be associated with our Git commits globally across all repositories on our system.
- ❖ **git remote add origin <repository-URL>** : The git remote add origin <repository-URL> command is used to link your local Git repository to a remote repository. <repository-URL> is the url of the GitHub Repository which has been previously copied and saved into the clipboard as mentioned in Step 3.
- ❖ **git commit -m "message"** : The git commit -m command is used to create a commit with a message in Git. This saves the staged changes into the repository history.

- ❖ **git push -u origin master** : The git push -u origin master command is used to push our local commits to a remote repository and set the upstream branch for future pushes and pulls. After giving this command, we are first taken to the GitHub sign-in page where after clicking the Sign-in using browser option, the files gets successfully pushed into the GitHub Repository from our local machine.

Step 6: The file is successfully uploaded into our GitHub Repository. Now click on Code. After clicking on Code, Click on Local and then copy the HTTPS URL and save it to the clipboard for future reference.

Step 7: Now create another folder in local machine. Right click on white space, and then click on Open Git Bash here.

Step 8: The Git Bash terminal opens up. Give the command step by step as follows-

- ❖ **git init** : The git init command is used to create a new Git repository. It creates a hidden .git folder that stores all the repository-related information, allowing you to track changes, commit files, and collaborate using Git.
- ❖ **git clone <repository-URL>** : The git clone <repository-URL> command is used to copy an existing Git repository from a remote source to our local machine. It downloads the entire repository, including its history and branches. <repository-URL> is the code url which has been copied as mentioned in Step 6.

```
MINGW64:/d/DS26_D
ASUS@LAPTOP-GUNTG33R MINGW64 /d/DS26_D
$ git init
Initialized empty Git repository in D:/DS26_D/.git/
ASUS@LAPTOP-GUNTG33R MINGW64 /d/DS26_D (master)
$ git clone https://github.com/MirrorofMam-CS427/DS.git
Cloning into 'DS'...
remote: Enumerating objects: 3, done.
remote: Counting objects: 100% (3/3), done.
remote: Total 3 (delta 0), reused 3 (delta 0), pack-reused 0 (from 0)
Receiving objects: 100% (3/3), done.
ASUS@LAPTOP-GUNTG33R MINGW64 /d/DS26_D (master)
$
```

Step 9: The Git Repository has been successfully copied into our local machine.
